

The New Generation of Light Paramotors is Born!

Chances are, you have seen these remarkable flying machines flying around somewhere, and have wanted to find out what all the buzz is all about. This sport is growing by leaps and bounds, and the Miniplane is by far the lightest, easiest and most reliable paramotor available today. A recent Independent Paramotor Owners Survey shows the highest overall satisfaction of the Miniplane!

The philosophy of a reliable mini-motor, combined with optimizing the resonance of the exhaust provides the pilot:
Light weight | Less vibration | Easier to start

Less fuel; less to carry

Less weight means a lighter frame

Less weight in flight means you can use a paraglider that is smaller and easier to inflate

Less weight gives you the ability to launch easier and under control - not struggling with a heavy load

The increase in performance of modern paragliders makes it possible to fly with almost one-half the power of a few years ago. *A little two-stroke engine, built with modern technology, can offer more than enough reliable power and much less weight.*

This makes the critical take-off run easier and safer.
